

CARE-ME

Computer-Aided data REtrieval for preventive MEdicine

The FP7 Research Project of five Universities:

- Exploration of clinical records
- Harmonization and integration

CARE-ME Project

List of participants

1. Federico II University of Naples,
Dept. of Clinical and Experimental Medicine
2. Humanitas IRCCS Hospital, Milan
3. University of Florence, Division of Cardiology
4. University of Bergen, Norway
5. Imperial College London, School of Medicine
6. InfoCodex AG Semantic Technologies, ICT Partner

CARE-ME Project: What is it about

Objectives (of the University Hospitals)

Build a *repository of integrated medical data gathered from distributed clinical records, containing masses of valuable but unexploitable patient data*

Real situation

Clinical records contain vast amounts of real-world patient data across a wide population, but these data cannot really be utilized because of their heterogeneous and unstructured formats

Role of InfoCodex

InfoCodex was chosen as the technology partner for *extracting, cleansing, and refining* the concealed, unstructured data

CARE-ME concept (designed by the 5 Universities)

Benefits of the CARE-ME Tool

Access to millions of real-world clinical records

Functions of the CARE-ME Tool

Benefits of the CARE-ME Tool

Opening of new
possibilities

Benefits of the CARE-ME Tool

Achievable improvements

Schematic Overview of the CARE-ME Tool

Data Integration

on

Keys to Success for the CARE-ME Tool

Facts extraction (cross-lingual)

- Extract and harmonize metadata (numbers and codes) embedded in text (laboratory values, bio-medical data)
- Determine patient type (age, sex)

Categorization of patient records (cross-lingual)

- Recognize and categorize syndromes, concomitant medication, adverse events
- Automatic Categorization of patients

Integrated statistical analysis, biometrics

InfoCodex
Semantic Technologies

InfoCodex AG *Semantic Technologies*

Exploration of Clinical Records

The FP7 Research Project of Five Universities

Other Potential Applications

Accelerated drug research (Biomarker experiment of Merck)

InfoCodex
Semantic Technologies

InfoCodex AG *Semantic Technologies*

Exploration of Clinical Records

The FP7 Research Project of Five Universities

Summary

Intention: Handle the growing flood of information and get significant added values

Competition: HP (Autonomy), Temis

USPs: Automatic understanding and categorization of unstructured information; handling and condensing masses of information

Why better: Quality and speed; no training; cross-lingual

Market: Pharma (e-discovery), media, R&D (all industries), information companies

Future The rapidly growing flood of unstructured info needs an automatic pre-digestion
